#### SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY MARK A OR DOTTED LINE WITH MARK ON THE SCHEMATIC DIAGRAMS AND IN THE PARTS LIST ARE CRITICAL TO SAFE OPERATION. REPLACE THESE COMPONENTS WITH SONY PARTS WHOSE PART NUMBERS APPEAR AS SHOWN IN THIS MANUAL OR IN SUPPLEMENTS PUBLISHED BY SONY.

#### ATTENTION AU COMPOSANT AYANT RAPPORT À LA SÉCURITÉ!

LES COMPOSANTS IDENTIFIÉS PAR UNE MARQUE A SUR LES DIAGRAMMES SCHÉMATIQUES ET LA LISTE DES PIÈCES SONT CRITIQUES POUR LA SÉCURITÉ DE FONCTIONNEMENT. NE REMPLACER CES COMPOSANTS QUE PAR DES PIÈCES SONY DONT LES NUMÉROS SONT DONNÉS DANS CE MANUEL OU DANS LES SUPPLÉMENTS PUBLIÉS PAR SONY.

#### SAFETY CHECK-OUT

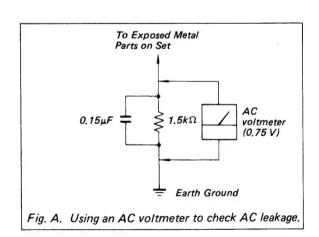

After correcting the original service problem, perform the following safety check before releasing the set to the customer:

Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

#### LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microampers). Leakage current can be measured by any one of three methods.

- A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
- 2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
- 3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2 V AC range are suitable. (See Fig. A)

## SECTION 3 MECHANICAL ADJUSTMENTS

#### · Refer to page 9 for Adjustment Location.

#### PRECAUTIONS

- Clean the following parts with an alcohol-moistened swab. (tape sliding surface)
  - Capstan

    Tape guide (S)

    Pinch roller (T)

    Pinch roller (S)

    Erase heads Record/playback heads
- Demagnetize the record/playback heads, erase heads and the capstan using the head demagnetizer.
- 3. Do not use a magnetized screw driver for the adjustments.
- 4. After the adjustments, apply suitable locking compound to the parts adjusted.
- 5. The adjustment should be performed with the rated power supply voltage unless otherwise noted.

#### Tape Passing Adjustment

Note: For the following adjustments, use the jig as far as possible. Although the following methods are operable without using the jig, precise adjustment may not be completed, for example no compatibility to other decks is available even if self recording and playback is OK.

In these adjustments, either the pinch roller guide in the S side or the record/playback head guide is referred to for tape pass. Therefore, do not unnecessarily rotate the adjustment screws including those of the erase heads unless any one is replaced. When 2 or more heads or pinch rollers out of these 2 heads and pinch rollers are to be adjusted or replaced, use the jig for the adjustments or replace one at first and then take complete tape pass and then replace the second one.

Minus screw driver

Large size ........Apply to the pinch roller adjusting screw in the S side.

- Pen light
- WS-48B (3kHz, 0dB)
- P-4-A100 (10kHz, -10dB)

#### Definition:

The following view relates to record/playback heads.

For the locations of the adjusting screws, see the view "adjustment location" in the lower right corner of Page 10.

#### Procedure:

#### Pinch roller in the S side

Note: It should be adjusted only when the pinch roller in the S side is replaced.

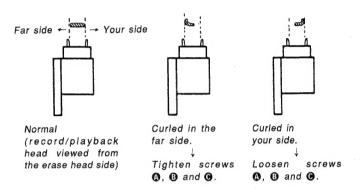

- 1. Mount the mirror cassette and set the equipment to playback state.
- Check that the tape is curled in the pinch roller guide or the guide of the record/playbakd heads.

If curled, remedy it by rotating the tape curl adjusting screw **(b)**. At tha time, check that the tape runs near the center part of the erase heads.

#### Record/playback heads

Note: The heads should be adjusted only when the record/playback head is replaced.

- 1. Mount the mirror cassette and set the equipment to playback state.
- 2. (Height adjustment) Check that the tape is curled in the tape guide of the heads. If curled, rotate screws 3, 3 and 6 in the same angle and move the entire heads parallel. Check the mirror cassette where there is curling and, when curling exists in the lower side (actually in the deep side), tighten all screws slightly. If curled in the upper (your) side, loosen them.

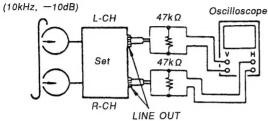

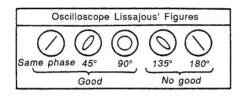

3. (Adjustment of tilting) Adjust back tension to 0 still in playback state (loosen the tape by rotating the reel in the S side using a small tip such as a pencil), and check that there is no curling or snaking (up or down) in the guide of the record/playback heads. Snaking of the tape may occur only within the range of a difference in the widths of the tape and the tape guide (it curls when tate slacks more than the range). Therefore, carefully check it because it may often be overlooked.

If the tape is snaking, rotate screws 3 and 6 in the same angle and change the tilting of the heads. Tighten or loosen the screws to remedy up or down snaking, respectively.

- Repeat the adjustment 2 and 3 again and converge the height and tilting to suitable positions.
- (Tentative adjustments of azimuth) Demagnetize and clean the heads and playback WS48B (3kHz, 0dB).
  - Rotate the screw **3** so that the pointer of the level meter of the set or connected to LINE OUT becomes maximum. If the screw is rotated more than 1/2 turn, repeat the adjustments again from 1.
- 6. (Checking of tape pass) Connect an oscilloscope to LINE OUT, replay P-4-A100 (10kHz, -10dB) to describe Lissajou's figures. At about 20 seconds after beginning playback (the tension in the loop becomes stable), check that the variation of the Lissajou's figures occur within ±90° (more preferably within ±45°). If beyond ±90°, adjustments of tilting or height will not be complete, so finely adjust the equipment again from 1.

Standard adjustment tape P-4-A100

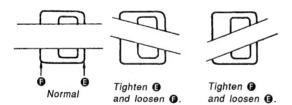

#### Erase heads

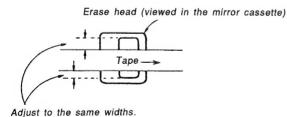

Note: The heads should be adjusted only when the erase head is replaced.

- 1. Mount the mirror cassette and set the equipment to playback state.
- 2. (Azimuth adjustments) Adjust screws 19 or 15 so that the tape runs as parallel to the erase heads as possible.

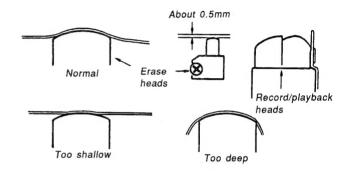

(Erase head viewed in the mirror cassette)

3. (Height adjustment) Rotate screws 0, 6 and 6 in the same angle so that the widths of erase heads seen in the upper and lower sides of the tape become essentially the same. If the width in the upper or lower side is larger, tighten or loosen the screws, respectively.

4. (Adjustments of tilting) Adjust back tension to 0 still in playback state and check that there is no snaking in the erase heads and pinch roller guide in the S side. If there is, change tilting by rotating the screw 10. When the tape moves up or down in the mirror tape, tighten or loosen the screw, respectively.

- 5. Repeat the adjustments again from 2. and converge the height and tilting to more suitable values. And, check that there are no tape curls in the pinch roller guide and the guide of the record/playback
- 6. (Adjustments of thrust) Slightly loosen the screw 6 and finely adjust it so that the tape smoothly runs over the entire surfaces of the heads by adjusting the thrust of the erase heads to an optimum value relative to the tape.

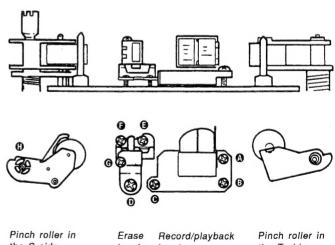

#### Checking

- Check that the tape smoothly runs over the entire tape pass without curling or snaking.
- After the adjustments, apply the locking compound to the screws adjusted (apply the compound to the screw @ only after the final azimuth adjustments are completed).
